The semantic web as a medium
Mediation problems
Conclusions

(French) National Research Institute in Computer Science and Control

- ▶ Governmental non academic research institute;
- ▶ 1500 employees — 8 centers;
- ▶ Bordeaux - Grenoble - Lille - Nancy - Orsay - Rocquencourt - Rennes - Sophia-Antipolis;
- ▶ 170 teams — 2900 scientists (3700 in total).

LIG

Exmo activity
The semantic web today
The semantic web as a medium
Mediation problems
Conclusions

Grenoble Computer Science Laboratory

- ▶ Laboratory associated to three universities of Grenoble, CNRS and INRIA;
- ▶ Axes:
 - ▶ Software and information system engineering
 - ▶ Formal methods, models, and languages
 - ▶ Interactive and cognitive systems
 - ▶ Distributed systems, parallel computing, and networks
 - ▶ Data and knowledge processing at large scale
- ▶ Network — Software — Interaction — Knowledge;
- ▶ 22 teams — 165 scientists (470 in total).

Exmo

Exmo activity
The semantic web today
The semantic web as a medium
Mediation problems
Conclusions

- ▶ Small team (three permanent researchers, 1 post doc, 3 PhD students);
- ▶ Recognised by both in INRIA and LIG;
- ▶ Started in 2000; formally in 2003;
- ▶ Computer-mediated exchanges of formalised knowledge (Échanges de connaissance formalisée médiatisés par ordinateur);
- ▶ Focussed on Ontology matching.

The semantic web as a medium

Mediation problems

Conclusions

Sharing knowledge at web scale

Dealing with heterogeneity

W3C Recommendations

- ▶ Ontology matching
- ▶ Alignment semantics
- ▶ Alignment composition (inference)
- ▶ Data interlinking and (link)key inference
- ▶ Query evaluation and containment

Theory — Software — Experiments

"The semantic web may be seen as a medium through which people communicate knowledge. Thanks to the vast amount of related knowledge it carries, it helps expressing meaning. However, due to its formal structure it may reveal as a difficult medium. We need to find ways to smoothly evolve it to ease communication. This means that such a medium is a dynamic structure. Fortunately."

Jérôme Euzenat, 29.11.2013

The screenshot shows a Google search for 'marie curie'. The search results include a knowledge panel for Marie Curie, a section for 'Marie Curie Filles' with images of Irène Joliot-Curie and Ève Curie, and a detailed Wikipedia-style entry for Marie Curie. The entry includes her birth and death dates, her education, her discovery of radium and polonium, her Nobel Prize, and her children. There are also links to related research and a small gallery of associated figures like Pierre Curie, Henri Becquerel, Albert Einstein, and Ernest Rutherford.

Plenty of data

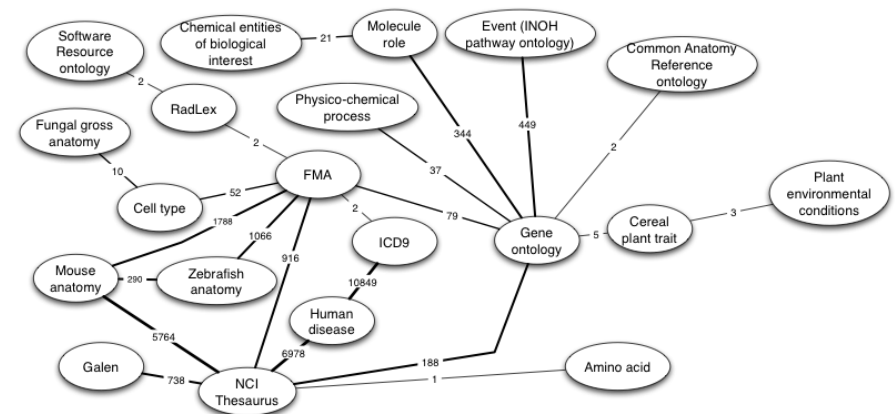

- ▶ LOD cloud (2011: 300 datasets, 31G triples, 500M links),
- ▶ CKAN/Datahub (2012: 4k datasets not all RDF, revision frequency increases)
- ▶ dpbidea.org (2012: 10M resources, 1.9G triples)
- ▶ Sindice (2011: 12+G triples)
- ▶ ODG, schema.org? (order of billions), GKG (2012: 500M resources, 3.5G facts)

Many ontologies

- ▶ Swoogle (2007: 10k ontologies)
- ▶ Watson (2007: 9.4k ontologies, 1.1M terms)
- ▶ Falcon (2012: 2.9k ontologies, 455k terms)
- ▶ LOV (2012: 284 ontologies)

Less alignments

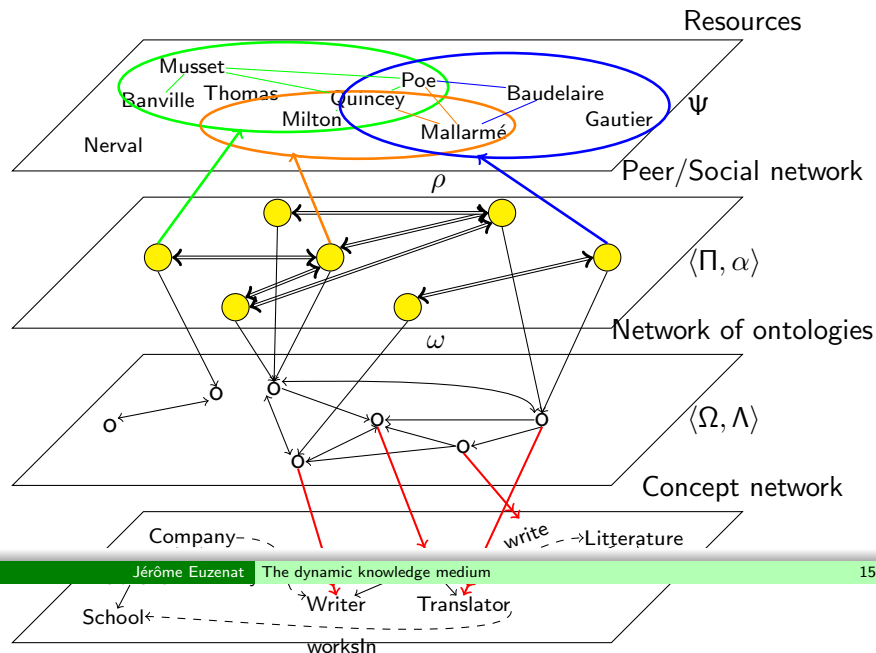

- ▶ Alignment server,
- ▶ Bioportal (322 ontologies, 5M terms, 10M mappings)

From: Natalya Noy, Nicholas Griffith, Mark Musen, Collecting Community-Based Mappings in an Ontology Repository, Proc. 7th International Semantic Web Conference (ISWC), pp371-386, 2008

The semantic web as a medium
Mediation problems
Conclusions

Network of ontologies

- From ontology alignments to linked data;
- From linked data to ontology alignments;
- More local inference (composition);
- Reasoning;
- Repairing, trusting, learning;

Networks of ontologies are living things

Exmo activity
The semantic web today
The semantic web as a medium
Mediation problems
Conclusions

- New ontologies appear or disappear;
- New alignments are created by different matchers;
- Alignments appear or disappear;
- Errors are corrected;
- Views of the world evolve;
- Data are created every millisecond.

We must be robust to that.

Jérôme Euzenat The dynamic knowledge medium

- ▶ The semantic web is like the web: heterogeneous and dynamic;
- ▶ Tools must be developed to deal with this;
- ▶ Not fight it.

Examples

- ▶ The telephone is a transparent medium (delay, awkwardness) but does not touch much the message,
- ▶ The web started first as a literal medium, but went more and more
- ▶ ... through search engines, first based on literal content, then on global opinion links, and through the mediation of complex algorithm, and now it uses the semantic web part...g,
- ▶ The thesis of Luca is about an active medium: it tries to present information in a way which it feels adapted to the situation (less awkwardness)

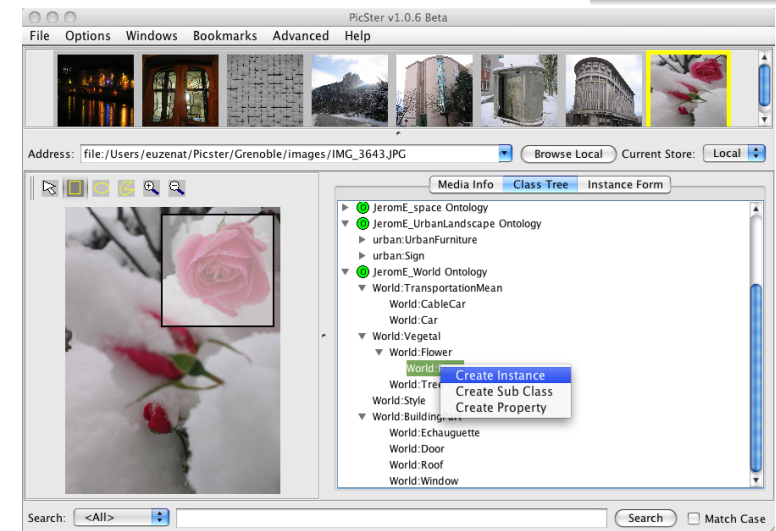

A medium?

A medium is a space (milieu) which supports communication.

What kind of medium the semantic web is?

- ▶ an active medium, tries to adapt the message,
- ▶ a dynamic medium: it is always changing,
- ▶ a formal medium

PicSter: an application

- How do we interact with the semantic web?
- How do we interact together through the semantic web?
- Can it be both flexible or rigid?

Here the communication is through people expressing ontologies, or publishing data.

- Inconsistency
- Unexpected consequences
- Incomplete consequences
- ≈ Misunderstandings

How to detect such problems?

- Direct feed back from users;
- Indirect usage feedback (not achieving –common– goals);
- Indirect feedback through data injection.

- ▶ Revise the ontology? the data? the alignments? Everything.
- ▶ Select a (consistent) subset of the semantic web which is sufficient for current communication?
- ▶ Prototype
- ▶ Maintain parallel alternative views?
- ▶ Find a way to negotiate ontology refinement so that it becomes consistent?

- ▶ The semantic web is a medium;
- ▶ Its formal structure mandates to develop evolution techniques;
- ▶ Much work has to be done.
- ▶ Fortunately.

If the medium is the message

What is the message of the semantic web?
